

Appendix: the two readings of f_θ are different dynamical systems

Left: Definition 1 applied to the bare utterance. Right: the deployed classifier, which also sees the task prompt and the last three messages. The contextual reading reproduces the logged runtime labels 1080/1080; the bare reading agrees with them 32.5% of the time. Same 1,080 messages and the same 810 transitions in both columns.
