

Crossing-transition contrasts (turn 2→3, N=54)

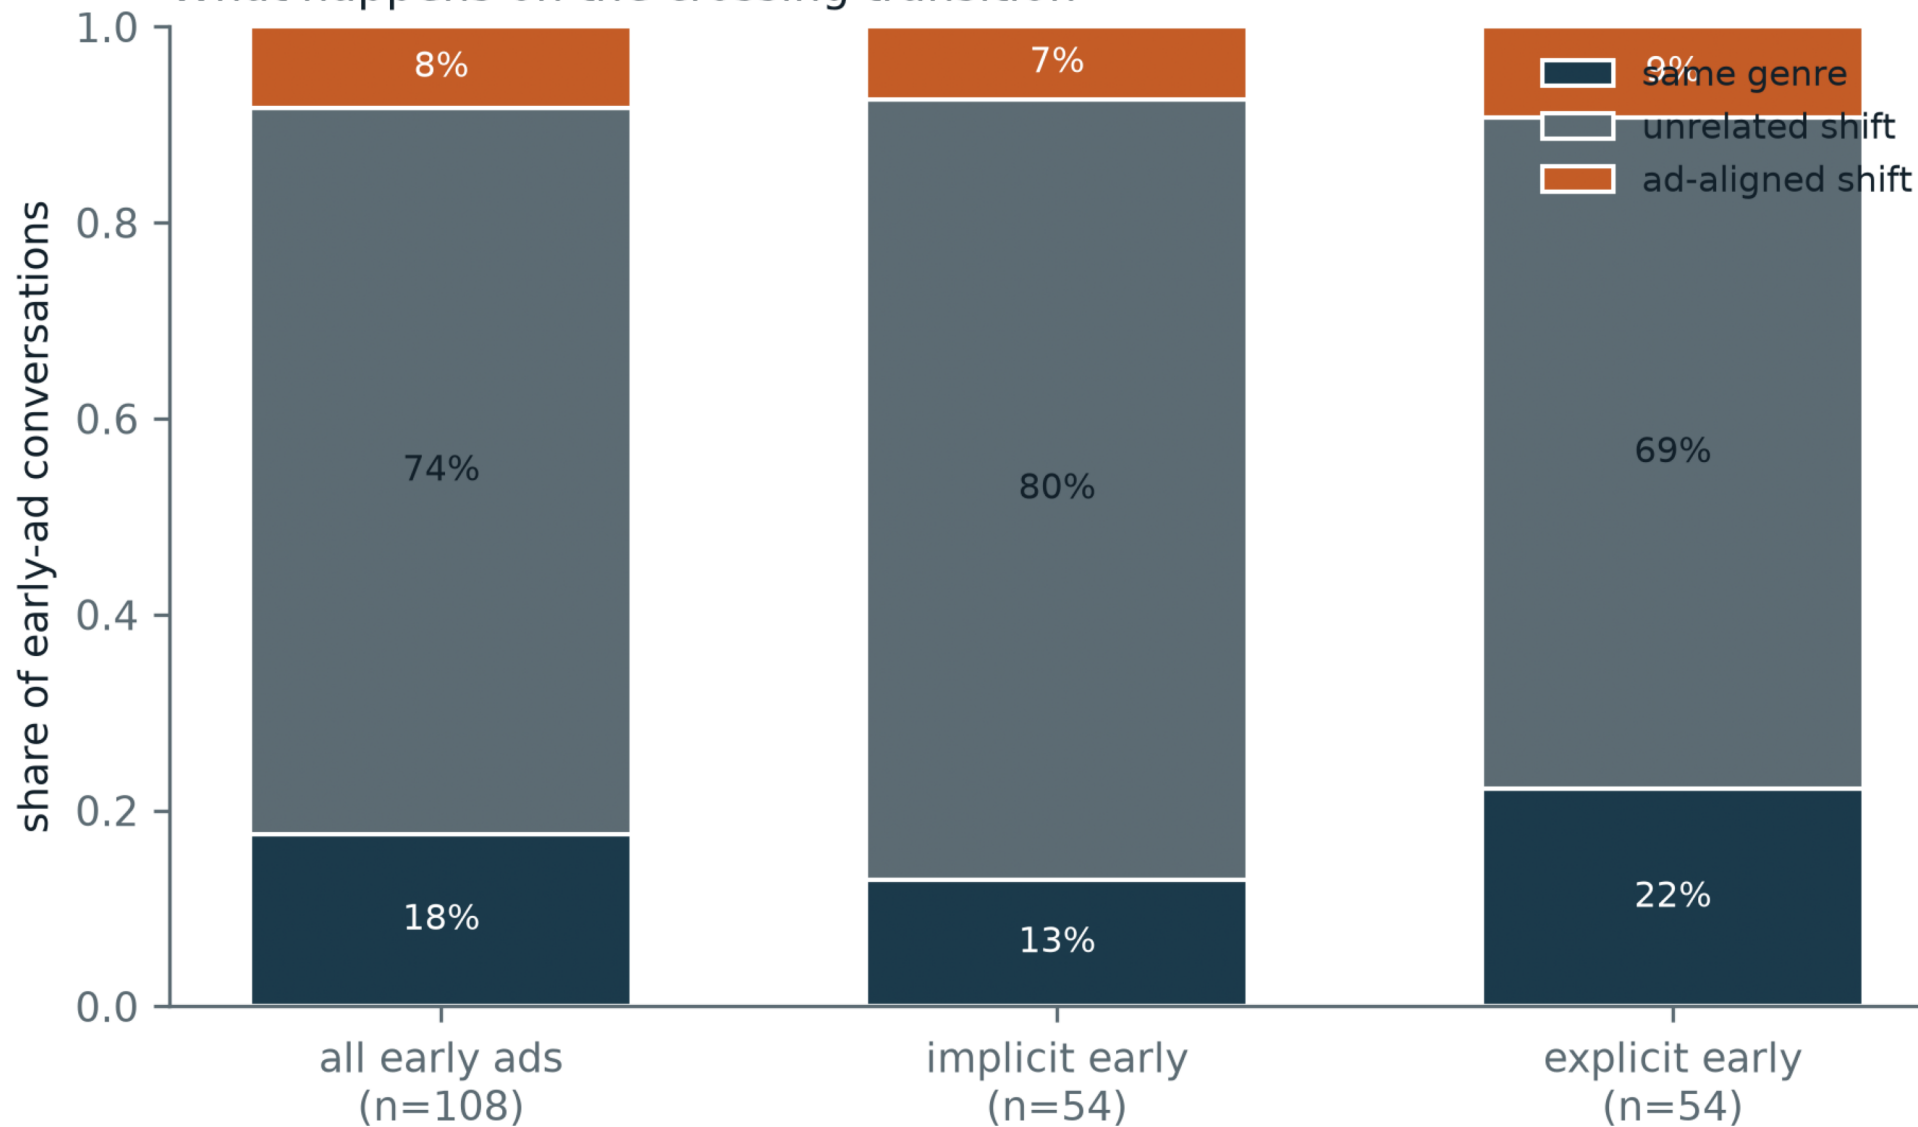

Navy is the confirmatory pooled contrast. Holm is within this family. No interval excludes zero.
The implicit – explicit row is the stage-4 type contrast on the same estimand. Hard labels only.

The instrument moves with depth; it does not move with advertisements

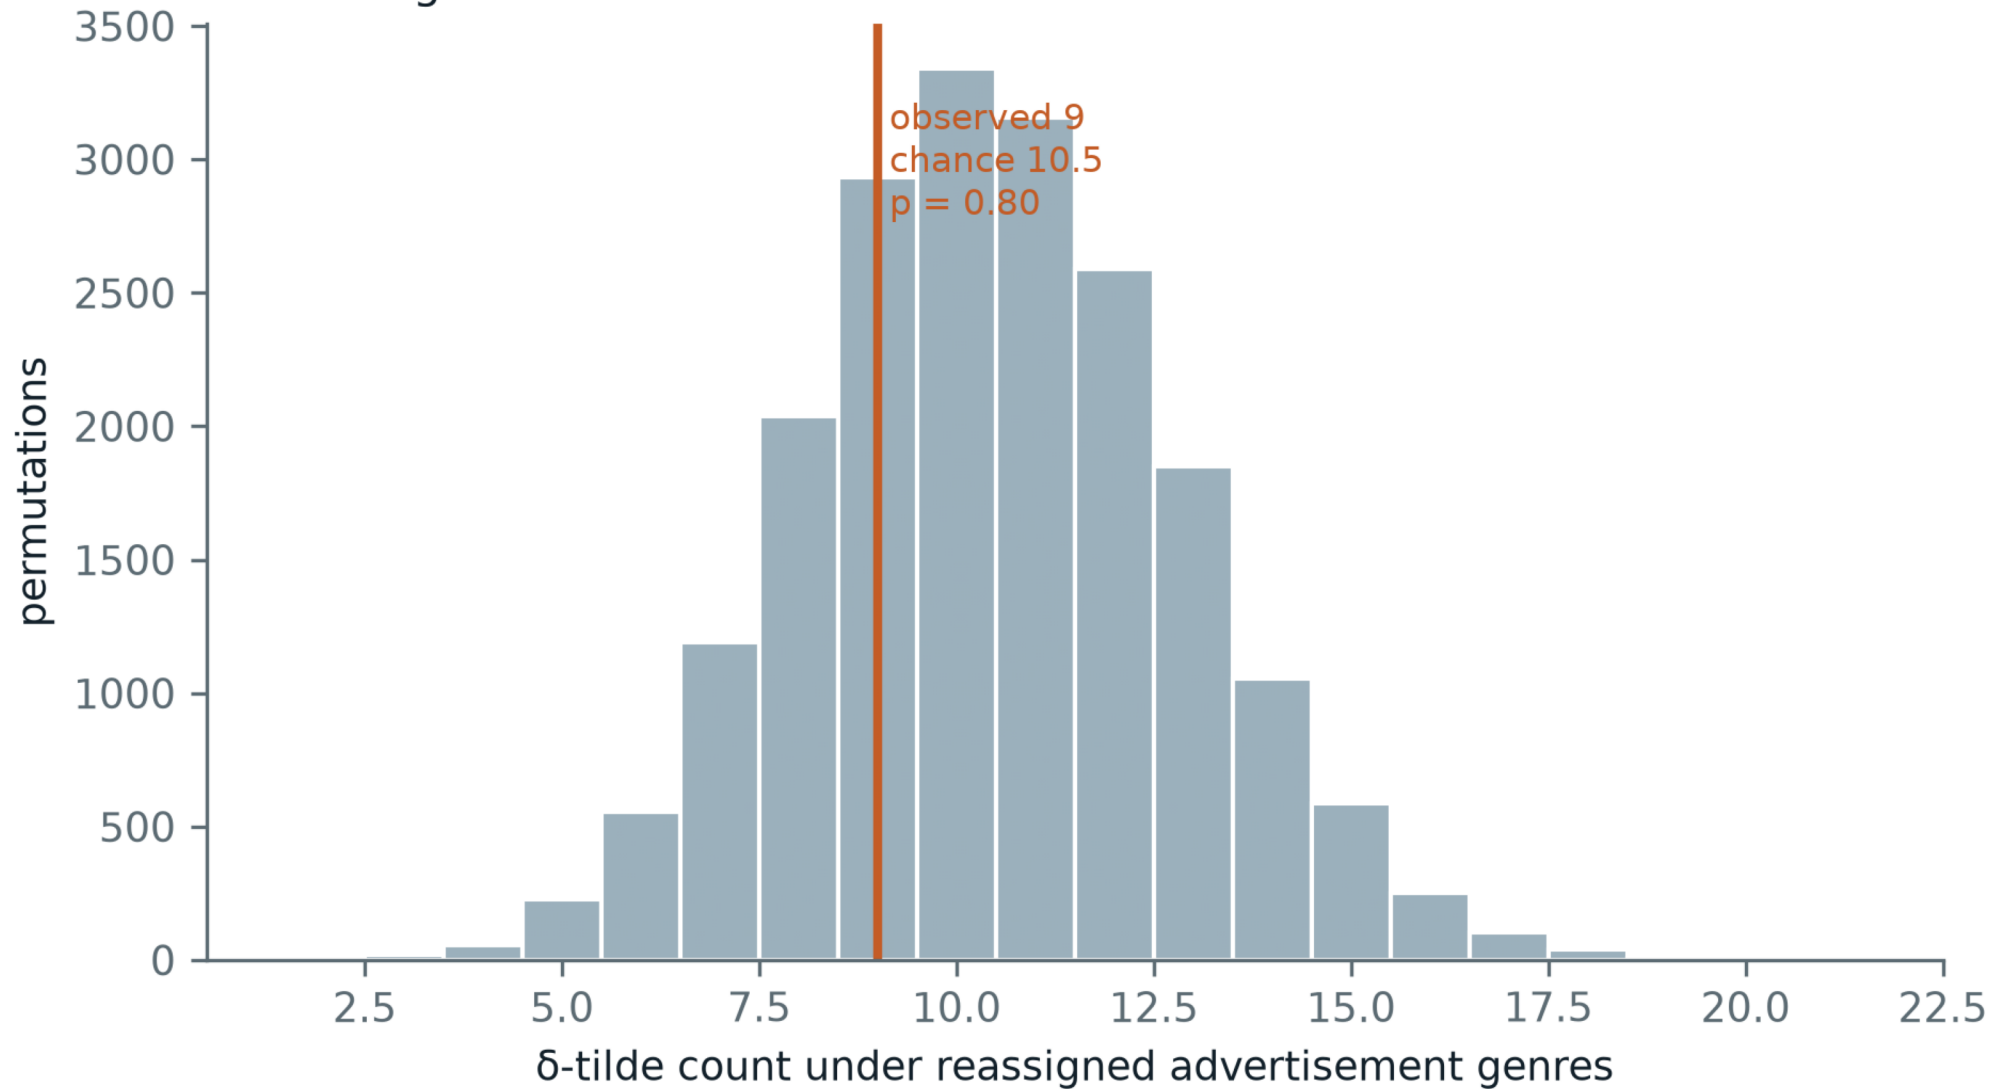

Left: person-level change in genre share from turn 1 to turn 4 (genres $\geq 5\%$ prevalence; clay = Holm $p < .05$).
Right: the family-A crossing contrast, same people. This is a pipeline check, not a second confirmatory test.

What happens on the crossing transition

Ad-aligned shift is $\delta\text{-tilde} = 1$. Primary labelling. Clay is the Definition 6 subcase; it is at chance under permutation.

Genre-aligned shifts are at chance

20,000 permutations that keep both marginals and destroy only the pairing. Primary labelling, 108 early advertisements.
