▲ Holm $p < .05$ ▲ Holm $p \geq .05$ ▼ estimate below zero • not estimated

Triangle direction is the sign of the estimate in the row's own units (higher trust ▲, higher manipulation ▲).
 Triangle count 1 / 2 / 3: $|d_z| < .2$ / $.2-.5$ / $> .5$; association rows $|\rho| < .3$ / $.3-.6$ / $> .6$ (▲ = positive ρ). 0: estimate exactly zero.
 Trajectory any-ad cells are early pooled ($\delta_2^{(a)}$) or late pooled (N_{shift}) minus a° ; condition-aggregation marginals are the post hoc pairwise sweep.
[†]Exploratory measure. Absolute δ is shown; relative α and β fall in the same explicit-early cell (Holm .026, .018).
